

Bowi Pumps & Levels Likes Complex Projects

Every now and then, any company requires an oxygen cure. Jean Paul Jackers has been taking care of it since he took over Bowi Pumps & Levels eight years ago. The company mainly distributes products of high-quality German brands and scores particularly well in projects where corrosion and abrasion resistance are essential. “A state-of-the-art product range, combined with a professional and dynamic approach, naturally lead to a continuous growth” confirms the enthusiastic manager.

BY BART VANCAUWENBERGHE

Jean-Paul Jackers took over the company, based in Zoersel and Liège, together with Stefan Munsch after having gained almost 25 years of experience in industrial fluid control systems. “Stefan is head of Munsch GmbH, a German manufacturer of solid plastic centrifugal pumps, available in multiple versions, plastic material, horizontal or vertical, standard or ATEX, with mechanical seal(s) or magnetically driven. The selection of a pump, approved by a MUNSCH engineer, is presented to the engineering department (of the customer itself or externally). That allows us, according to the customer’s preferences and application, to justify our pump configuration, including plastic material, seal system, flushing method and other eventual options.”

Schmitt and Visco Jet

BOWI Pumps & Levels has been distributing SCHMITT pumps for two years already on the territory of France-Belux. “By doubling the turnover in this territory in two years we have been able to prove to Moritz, commercial director of SCHMITT, that he had made the right choice”. Beyond renowned SCHMITT pumps, this success is mainly due to the complementarity with the MUNSCH ranges. SCHMITT also covers horizontal or vertical centrifugal pumps, in PP or PVDF, standard or ATEX, with

mechanical seal(s) or magnetically driven. They come with lower operating ranges in terms of flow rate, pressure or solid particle size. Another novelty, another complementarity: On top of MUNSCH and SCHMITT centrifugal pumps and JOLA level and leak detection installed above and around the tank, VISCO JET agitators have been completing our product range for more than a year. “Their innovative and patented agitating technology stands out for its efficiency in the most diverse industrial sectors” explains Jean-Paul Jackers.

Exclusivity

BOWI Pumps & Levels continues its growth. “We appear in various trade fairs and technical magazines”, continues the manager. It is also important to note that we distribute our renowned brands exclusively on our territories. BOWI prioritizes the satisfaction of its customers by keeping promises. Whether it is submitting an offer on time, responding quickly to a technical or logistical question, confirm an order or process a complaint. The company’s expertise is particularly renowned in wastewater treatment, metallurgy and chemistry. “We recently realized a significant number of projects in niche markets.

BOWI always promotes the opportunity to take customers onto a common trip to the German manufacturers.

Our pumps are used in wastewater treatment, steel manufacturing and chemical process Industry among other segments.

Here, they can see with their own eyes that the production is carried out with rigor in a respectful work environment with the strictest standards. Communication with our suppliers happens smoothly and intense. All our employees are continuously informed of their innovations through webinars. “This allows us to offer our customers the most relevant and recent solution at any time” concludes Jean-Paul Jackers.
